Control Flow Statements and Looping Statements in Python

Name: Sriram Attavar | USN: 25BCAR04161 | Semester: 2 | Section: K

Aim

To write a Python program to implement control flow statements (if, if-else, if-elif-else) and looping statements (for loop, while loop, break statement, continue statement) and to study their execution and output.

Algorithm

1. Start the program.
2. Take a number and use nested if-elif-else to check whether it is positive, negative, or zero, and whether it is even or odd.
3. Use a for loop with range() to generate and print the multiplication table of a given number.
4. Use a while loop with a counter variable to compute the sum of the first N natural numbers.
5. Use a for loop with the break statement to find and print the first number in a range that is divisible by 7, then exit the loop.
6. Use a for loop with the continue statement to skip even numbers and print only the odd numbers from 1 to 10.
7. Display the output of each step.
8. Stop the program.
